Put your trust in cysmo®

ZERO FALSE POSITIVE

Stop wasting
time on noise.

In the world of cyber risk assessment, one thing matters above all: accuracy.

Most tools on the market are based on guesswork, scouring unknown subdomains or flooding cyber managers with vague or irrelevant alerts. The result? A signal-to-noise ratio that undermines trust, wastes time and threatens the quality of the decision.

cysmo® is engineered differently.

Built 100% for cyber insurers, cysmo® provides real-time, outside-in cyber risk ratings — without the noise. Our unique approach: Only domains explicitly confirmed by the insured company are assessed. This ensures that every identified risk is technically relevant, verifiable, and directly attributable.

Our difference is technical validation. cysmo® requires companies to actively provide their domain.

- Domain-based, technically verified scanning
- Non intrusive methods
- Full transparency into data and scoring
- Results in 1–2 minutes
- GDPR-compliant, globally trusted

Our core principle? Zero False Positives.

By requiring the company itself to confirm the domain, cysmo® ensures that only what truly belongs to the company is scanned.

This simple yet powerful difference guarantees:

- Domain-based, technically verified assessments
- High-quality, trustworthy data
- Accurate cyber risk scoring
- No false positives – highest maxim

✓ **Eliminating confusion**

No guessing, no alert fatigue — just clean, verified signals.

✓ **Supporting fast decisions**

Data you can actually rely on. Risk clarity in seconds.

✓ **Built on company-verified domains**

Only what's real is rated. No assumptions. Ever.
